

Fly Management

Flies are nuisance. They go buzzing around and play important role in nature, like pollinating plants and breaking down organic material. Serving as food for other bugs and animals.

Due to the wastage and spoilage of food can cause negative impact to company financially.

Flies acts as scavengers consuming the rotting matters. Flies spread diseases like food poisoning and dysentery.

Several fly species need blood to reproduce, so they bite humans. They pick up pathogens from the organic matter and transfer the same to the food they site on. Flies life span is for 30 to 60 days.
